

As surface, and a second portion extending radially beyond the bearing surface of the first portion, the first and second portions being integrally formed, the housing part having an engagement surface and a hinge surface, the hinge surface co-operating with the bearing surface of the first portion and the engagement surface engaging with the second portion to restrain the shaft part from rotational movement, the shaft part being moveable relative to the housing part between a first position in which the second portion is engaged with the engagement surface and a second position in which the second portion is not engaged with the engagement surface.

---

Ag 9. (Amended) An electronic device comprising a first body element and a second body element connected by a hinge, the hinge comprising a shaft part and a housing part, the parts being relatively moveable about a common axis of rotation, the shaft part having a first portion lying on the common axis of rotation, the first portion carrying a bearing surface, and a second portion extending radially beyond the bearing surface of the first portion, the first and second portions being integrally formed, the housing part having an engagement surface and a hinge surface, the hinge surface co-operating with the bearing surface of the first portion and the engagement surface engaging with the second portion to restrain the shaft part from rotational movement, the shaft part being moveable relative to the housing part between a first position in which the second portion is engaged with the engagement surface and a second position in which the second portion is not engaged with the engagement surface.
